

How to couple Series N700 Shinkansen Bullet Train

10-547, 10-548 or 10-549 N-scale train Series N700 Shinkansen Bullet Train "Nozomi" (Hope) is equipped with new couplers, which does not mar the outlook of all-around diaphragm and enables the train to run smoothly on curves. This coupler is designed very finely. Please read the instructions carefully and make sure that the cars are coupled with each other properly.

① Make sure that the white coupling guide and grey coupler are connected respectively with their fitting parts.

② Be sure that the hook on the inside diaphragm catches the slit on outside diaphragm.

③ In case the outside diaphragm is found off the inside diaphragm when the car is taken out of the case, insert and hook the outside diaphragm into the inside diaphragm properly before running the train.

Final check

④ If a gap arises between the outside and inside diaphragms as shown in the picture when the train runs on a curve, the connection is not in order. The outside diaphragm should be connected with both inside diaphragms without gap even when it is slid out on a curve.

⑤ If the outside diaphragm does not pull out the inside diaphragms from both-side car -ends properly, the connection is not in order.

Outside diaphragm
